The negative control was a 96-well plate treated as described above for bacteria but without adding any *B. subtilis* cells. The 96-well plate was cultured for 24 h, then the recorded optical density (OD) value was obtained by a microplate reader (Epoch, BioTek, USA). The *L. lactis* survival rate was calculated according to the following formulas: Survival rate (%) = (OD$_{experiment}$ − OD$_{blank}$)/(OD$_{t0}$ − OD$_{blank}$) × 100%. Where OD$_{experiment}$ is the OD value of treatment group in the experiment, OD$_{t0}$ is the OD value of the control group at time zero, and OD$_{blank}$ is the OD value of the blank group in the same experiment. The experiment was repeated three times and data was expressed as the mean value ± standard error.
