A: The main website of the RAR's group is actually a mirror of the website of the RAR's group. In that website, you can find for each available version of a RAR the malware-related information (e.g. AntiVir and Dr. Web), as well as the hashes of the RAR itself (this information is useful to verify that the RAR you downloaded is not corrupted). A RAR may be malicious or may not, depending on a couple of factors: the original source of the RAR the purpose of the RAR the software used to create the RAR the software used to extract the contents of the RAR The RAR you are talking about has been downloaded at the URL that I shared above and has been already analyzed by several antivirus companies that have already published their findings. Anti-virus software AV-Comparatives.com has published a thorough analysis of the RAR here: Dr. Web has published a thorough analysis of the RAR here: Riskalyze has published a thorough analysis of the RAR here: The last two reports are not official, but are based on an independent analysis of the file. If you want to be 100% sure that you are not infected by the malware in the RAR, you can read their official articles or scan the RAR yourself with the free version of Dr. Web or other free anti-malware software. If you want to be 100% sure that the RAR is not corrupted, you should try to download a similar RAR from another source, preferably from a trusted source. The present invention relates to an antenna apparatus used for a wireless communication apparatus such as a mobile telephone or the like, and a communication system using the same. FIG. 20 shows an example of an antenna apparatus. In FIG. 20, reference numeral 1 designates a coaxial rod antenna, and 2 a ground conductor. The antenna apparatus is formed by the rod antenna 1 and the ground conductor 2. The antenna apparatus has an electromagnetic shield portion 3 of an electrical conductive material at the lower portion of the antenna 1, and an electric conductor portion 4 formed by joining a magnetic material to the lower portion of the electromagnetic shield portion 3. The electric conductor portion 4 has an arrangement in which conductor pins 5 are axially aligned and fixed. Further, the magnetic material is connected to the conductor pins
