Category:Jotun Paints Category:Painting and drawingQ: Passing a string through form to php script for processing and printing results in form of string I have a form to login to my website. I've implemented a basic form with form\_open() and form\_submit() of the register.php form using \$my\_data = \$\_POST['form']; In this form, I have a link that takes me to the login.php form, I've implemented this by using the form\_open() and form\_submit() again, but this time when I pass it through to the login.php script, it automatically gets the input in the form \$\_POST['form']; Is there a way to get the value of the string that is passed in the form \$\_POST['form']; and output it in the same manner it was passed to it? This is my first question so please let me know if I'm not making any sense. A: Form can only contain \$\_POST or \$\_GET variables. You cannot add more variables with \$\_POST['form'] except in hidden inputs. Use session variables or hidden inputs to pass other values. This is a standard variable\_request\_name[variable\_name] pattern. This is very common to most of PHP scripts. If you are concerned about security, you might want to add type='hidden' and name='variable\_name' values in HTML tags. Q: Partitioning a table in multiple sets and aggregate by matching rows If I have a set of data which looks like this: PersonId Code Amount ----- 1 11A 2 1 11B 2 1 11C 2d92ce491b
