May 3, 2020 A live streaming repository containing all adult Kodi add-ons as well as minor 17+ add-ons not for public use. An add-on can be added from the link above but it is recommended to use a manual add-on manager like the one available from the link above. XBMC TV is a free, open-source software (OSS) for both PC and mobile devices. For the Kodi Software version 16.x.x and below, all XBMC Add-ons (including the XBMC Update Service) are enabled. Please consider this website as a source of information for Kodi Add-ons, not as a Kodi media center. See also Kodi References External links Category:Kodi Category:Cinema and film software Category:Internet television Category:Streaming media systems Category:Free media players Category:Open-source video softwareQ: How to get result of Update-SPSite from variable in PowerShell I'm trying to use a single script to update a list of sites and a collection of users in that site, but I can't seem to get my update statements right. I get no errors, but I get no results, and I think the problem is the Svariable in the \$updateList = \$spsite.Update(\$variable) statement. Here's what I'm trying: \$updateList = \$spsite.Update(\$updateUserList) \$updateList = \$spsite.Update(\$updateList) I'm running this script in the SharePoint Central Administration console on my local machine, and the return value of \$updateList is always empty. What am I doing wrong? A: You need to pass the object by value, not by reference, and then update the list in the variable, not create a new object \$site = Get-SPSite \$list = \$site.Lists["Your List"] \$updateList = \$site.Update(\$list) \$updateList If you use \$spsite.Update(\$updateUserList) you are updating a list by using it as \$updateUserList instead of \$updateList /\* Copyright (c) 2003-2012, CKSource - Frederico Knabben.
