Q: How does this WinForms WMI query return a List rather than a query result? I am trying to write a simple Winforms app that just returns a list of all installed printers. I am using this method and it works, but I am a bit confused about the List that is returned. public static List GetPrinters() { StringBuilder sb = new StringBuilder(); ManagementObjectSearcher searcher = new ManagementObjectSearcher ("SELECT * FROM Win32_Printer", "SELECT * FROM Win32_Printer WHERE AdapterType = \"USB\""); foreach (ManagementObject queryObj in searcher.Get()) { sb.AppendLine(queryObj["Name"].ToString()); } return new System.Diagnostics.CodeAnalysis.Selector[](sb.ToString().Split(new Char[] { ' ' }, StringSplitOptions.RemoveEmptyEntries)); } After it has done this it executes the GetPrinters() method again, and rather than just returning a reference to the already created List, it returns the whole Selector object back. I have tried wrapping this in a list, but it still returns the object itself. public static List GetPrinters() { // Code from above return new List(sb.ToString().Split(new Char[] { ' ' }, StringSplitOptions.RemoveEmptyEntries)); } Am I missing something? A: Most of the LINQ methods return an iterator. If you want to get an actual list of values from a query object, use the ToList method. System.Diagnostics.CodeAnalysis.Selector[] list = sb.ToString().Split(new Char[] { ' ' }, StringSplitOptions.RemoveEmptyEntries).ToList

Q: Purpose of the src parameter in Callable According to this here callable has a parameter named src which defines the image to the generated image. This is the only parameter in the example: Resources res = activity.getResources(); Bitmap bitmap = BitmapFactory.decodeResource(res, R.drawable.ic_launcher); and it is optional (which is a bit weird given that BitmapFactory has it's own source parameter). Here is the definition of the Callable method in the source code: public Callable newCallable(Context c, int res, int id, String source) { return new BitmapRun(c, res, id, source); } My question is why you have a src parameter that is not used? If you have a src parameter, shouldn't it be used in the generated image? A: If you wish to use the same source each time, then you can do so with the src parameter. For example: new Callable() { @Override public Bitmap call() throws Exception { return BitmapFactory.decodeResource(activity.getResources(), R.drawable.ic_launcher); } } This defines a simple Callable which returns the same Bitmap each time it is called, but you can define it differently if you wish. Q: What is the best way to colorize json, dict and list, based on the key name? Suppose I have these data: data = [{'amount': amount, 'color': 'red'}, {'amount': amount, 'color': 'white'}, {'amount': amount, 'color': 'blue'}, {'amount': amount, 'color': 'pink'}, {'amount': amount, 'color': 'yellow'}, {'amount': amount, 'color': 'green'},] Which I colorize them based on the key names: {amount: {
