Many new Photoshop users may have some questions when they first start editing their images: How do I select the layer I want to edit? How do I make layers transparent? How do I combine two images into one? How do I make one image fade into another? How do I organize a group of layers into a single file? How do I use the powerful tools available to me in Photoshop? The answers to these questions are covered in the rest of this article. Photoshop's Layers: Editing and Combining A very important concept for Photoshop is the notion of layers. A layer is a digital blueprint that describes each element of a graphic. When working with Photoshop, you must treat each layer like a separate object, rather than a group of objects or characters within an image. Layers are organized by default by the order in which you create them. From top to bottom, Photoshop starts your image from the most recently created layer. The most recently created layer is the current layer and is highlighted in Photoshop when you are viewing the layers dialog box. It is a common misconception that a Photoshop image is built out of layers. In reality, your image is made up of layers, but there are only as many layers as your viewport supports. Anything you don't see in the viewport is really just a composite of layers that Photoshop is showing you on a transparent background. Select the current layer by clicking on the "L" tool on the Layers palette (located at the top left of your screen in the image below). After selecting the current layer, click on the Select button to highlight your first subject or image in your image as you work on it. Click on the "Arrow" button and drag out the selection you want to select. After highlighting your selection, you will see a white area in your image that represents the area of your selection. You can use the "V" tool to select inside or outside your selection by clicking on the Selection tool highlighted by the diamond-shaped icon. Clicking on the "V" tool will toggle between selecting outside and inside of your selection. You can also select multiple objects and combine them into a layer. To do this, select the objects you want to be in a group, then click on the Create Layer button in the Create Layers panel. When you select multiple objects, a new layer will be created with all the objects

Thursday, February 23, 2008 The Hunchback of Notre Dame This is my favorite example of Catholic church art in Europe. The Hunchback of Notre Dame in the cathedral in Rheims, France, depicts Quasimodo and the other characters from Victor Hugo's classic novel. In the novel, Quasimodo is a man with a hunchback, a deformity resulting from an accident in his youth. His appearance triggers horror and pity in those who see him, and he is confined to the bell tower. He is used by the bell ringers to control them. Quasimodo originally thinks the bell ringer is named Phoebus, but he realizes that the bell ringers are in fact captives of their master, Claude Frollo, who intends to marry the beautiful gypsy girl Esmeralda. This is a truly great Gothic cathedral, in the tradition of St Mark's in Venice. It's my hope that, after the recent spate of damaged or destroyed religious buildings in the U.S., people will start to appreciate the great church art that we have here in Europe. The present invention relates to a new and distinct cultivar of Kalanchoe plant, botanically known as Kalanchoe blossfeldiana, and hereinafter referred to by the name 'Crema'. The new Kalanchoe is a product of a planned breeding program conducted by the Inventor in Aalsmeer, The Netherlands. The objective of the breeding program is to create new compact Kalanchoe cultivars with attractive foliage and flower coloration. The new Kalanchoe originated from a cross-pollination made by the Inventor in 2003 in Aalsmeer, The Netherlands, of a proprietary selection of Kalanchoe blossfeldiana identified as code number 9970-1, not patented, as the female, or seed, parent with a proprietary selection of Kalanchoe blossfeldiana identified as code number 9870-1, not patented, as the male, or pollen, parent. The new Kalanchoe was discovered and selected by the Inventor as a single flowering plant within the progeny of the stated cross-pollination in a controlled environment in Aalsmeer, The Netherlands, in April, 2003. Asexual reproduction of the new Kalanchoe by terminal cuttings in a controlled environment in Aalsmeer, The Netherlands since June, 2003, has shown that the unique
